

# Acute myelomonocytic leukaemia (AMML)

Acute myelomonocytic leukaemia (AMML) is a rare, fast-growing blood cancer. Find out what AMML is, the signs and symptoms, and how it is diagnosed and treated.

## Summary

- AMML is a rare, fast-growing blood cancer.
- We do not know the exact cause of AMML, but it not because of anything you have or have not done.
- AMML is usually diagnosed from blood tests and bone marrow tests.
- You might have intensive or non-intensive treatment for AMML. Your team will tell you what they recommend for you.
  - Intensive treatment aims to get AMML into remission.
  - Non-intensive treatment is gentler. It aims to control AMML as much as possible rather than cure it.
- It can be hard dealing with side effects and treatment. Ask your friends, family, medical team or Leukaemia Care if you need support.

## About AMML

AMML is a fast-growing blood cancer. It is a rare type of [acute myeloid leukaemia \(AML\)](#).

AMML develops when immature white blood cells called myeloblasts and monocytes divide uncontrollably. They build up in your bone marrow and stop it making enough healthy blood cells.

**We do not know the exact cause of AMML, but it is not because of anything you have or have not done.**

## Signs and symptoms of AMML

The signs and symptoms of AMML include:

- Fatigue
- Fever
- Infections
- Feeling breathless
- Low red blood cell count (anaemia)
- Bruising or bleeding
- A swollen spleen or liver
- Swollen lymph nodes

AMML is usually diagnosed from blood tests and bone marrow tests.

## Treating AMML

[Treatment options](#) for AMML are similar to those used for other types of AML.

Your haematology team will recommend either **intensive** or **non-intensive** treatment, depending on your individual needs.

Your team will explain what treatment they recommend and what you can expect from treatment.

We have separate [information on different treatments](#).

### Intensive treatment

Intensive treatment happens in phases.

#### Induction phase

- Aims to kill as many leukaemia cells as possible.
- Usually involves chemotherapy, sometimes with a targeted medicine.
- You usually stay in hospital for a few weeks to have it.

#### Consolidation phase

- Aims to kill any leukaemia cells that may be left.

- Often involves cycles of chemotherapy, sometimes with a targeted medicine. Some people might have a stem cell transplant.
- You usually have it in hospital and go home between cycles.

### **Maintenance phase**

- Aims to reduce the risk of your AMML coming back.
- Usually involves tablets to take at home.

### **Non-intensive treatment**

Non-intensive treatment is gentler. It aims to control your AMML as much as possible rather than cure it. It usually involves low-dose chemotherapy or targeted therapy to take at home.

## **Outcomes of AMML**

The outcome of AMML varies from person to person. Your medical team are best placed to discuss what they expect for you.

**It can be hard dealing with treatment and its side effects. Don't be afraid to ask for help from family, friends, your medical team or Leukaemia Care.**
